

The Innocart trolley for Innocor® when used in an exercise testing environment

Innocor®
innovision

The Innocart

In an exercise lab Innocor[®] is most often used for exercise stress testing, where the test subject needs his/her arms to stabilize his/her body during running or biking.

In this case it is necessary to have Innocor[®] placed appropriately next to the treadmill or ergometer. Equally important is the possibility to move around with the Innocor[®] to another treadmill or ergometer.

The Innocart provides:

- A solid work platform for the Innocor[®] device
- A shelf for your notes with a drawer for extra supplies of mouthpieces, filters, cuffs, etc.
- A shelf for the printer
- Wheels for easy transportation of the whole system around the exercise lab or even to another room
- Proper fitting of the support arm, which enables the test subject to have his/her arms free for exercising
